

WAP to train and evaluate a convolutional neural network using Keras Library to classify MNIST fashion dataset. Demonstrate the effect of filter size, regularization, batch size and optimization algorithm on model performance.

In this experiment, I will build a CNN model using Keras and TensorFlow to classify images from the Fashion-MNIST dataset. The program will include data preprocessing, model training, and evaluation. It will also show epoch-wise accuracy and loss and generate graphs to analyze the results. Different kernel sizes, regularization methods, batch sizes, and optimizers will be tested to study their effect on model performance.
